

True operational capacity requires data systems that are local, deterministic, and held entirely within your physical custody. The **SHIM Engine** is a sovereign, layout-aware data engineering platform built to transform complex, high-liability construction documentation into instant structured insights. Running 100% on-premises, our system completely eliminates the data security hazards, layout inaccuracies, and unpredictable transaction fees associated with public cloud platforms.

// PLATFORM CAPABILITIES

Spatial Geometry Mapping Bypasses traditional, brittle OCR systems to track layout vectors, multi-column tables, and nested engineering grids natively to maintain perfect structural data alignment.	UI-Only Storage Boundary Enforces rigid data custody rules. Organisational files are processed transiently inside local container memory (RAM) and immediately purged post-analysis.	Deterministic Execution Feeds high-density Markdown streams into local, offline compute units. Utilises hardcoded Python validation rules to completely eliminate generative hallucinations.

// TARGET APPLICATIONS & SITE IMPACTS

WORKLOAD TARGET	CORE OPERATIONAL IMPACT
Subcontractor Onboarding (SWMS)	Automatically scans incoming subcontractor safety PDFs at the site office. Flags missing risk controls, generic boilerplate text, and incomplete logs for rapid automated audits.
Structural Design Auditing	Parses dense engineering computation packets, layout drawing updates, and Regulation 126 certificates to cross-reference structural tolerances with zero manual exposure.
Commercial Variation Tracking	Processes unstructured multi-page supplier manifests, material invoices, and site log adjustments into clean schemas for immediate site financial reconciliation.

// STRATEGIC INFRASTRUCTURE PILLARS

1. 100% Data Safe Deploys as an air-gapped network sandbox on physical local server appliances. Zero site data or personal identifiers ever leave the room.	2. Immediate Verification Maintains perfect tabular relationships across layout-dense documents, supporting instant visual validation using programmatic bounding box overlays.
3. Cost Predictability Bypasses cloud utility metered credit models that penalise deep analysis. Delivered via a flat-rate local equipment lease with zero variable transaction fees.	4. Frictionless Procurement Structured as a low-value asset lease qualifying for operational expense (OpEx) pools. Fits inside local site budgets, bypassing corporate CapEx approval loops.
